ITEC 204 – Data Structures and Algorithms

Name: VICENTE, VHAL SIEGRID B.	Date: 9/25/2026
Section: BSIT – 2B	Instructor:

- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

Answer:

My program is designed to simulate an Incident Ticket Manager using a linear data structure (list). It allows support teams to add, display, search, remove, and count incident tickets generated by automation bots. This demonstrates how lists can be applied in IT automation scenarios to organize and manage records efficiently.

- II. **Program Operations:** Briefly explain how your program performs each operation. (Insert Specific Code Line and Your Explanation)

Add Incident:

- ```
tickets.append([input("Incident ID: "), input("Bot: "), input("Description: ")])
```
- This line appends a new incident ticket (ID, Bot, Description) into the list.

**Display Incidents:**

- ```
for t in tickets:  
    print(t[0], "|", t[1], "|", t[2])
```
- This loop prints each ticket's details sequentially from the list.

Search Incident:

- ```
for t in tickets:
 if t[0] == id:
 print("Found:", t[0], "|", t[1], "|", t[2])
 break
```
- This checks each ticket's Incident ID. If it matches, the program displays the ticket.

**Remove Resolved Incident:**

- ```
for i in range(len(tickets)):  
    if tickets[i][0] == id:  
        tickets.pop(i)  
        print("Removed.")  
        break
```
- This searches by Incident ID and removes the matching ticket from the list.

College of Computer Studies

Count Active Incidents:

```
print("Active tickets:", len(tickets))
```

- This prints the total number of tickets currently stored in the list.

III. **Flowchart:** Create a flowchart showing the overall process and logic of your program.

IV. **Conclusion:** Briefly explain what you learned from the activity and how the linear data structure was applied.

From this activity, I learned how to apply a linear data structure to organize and manage multiple incident tickets efficiently. Each operation adding, displaying, searching, removing, and counting was performed by accessing elements sequentially within the list.
